Pumice Stone - Small

Pumice is formed when hot volcanic lava and water mix together. It's a light-yet-abrasive stone used to remove dry, dead skin. A pumice stone can also help soften your calluses and corns to reduce the discomfort from friction.

This stone can be used daily, but it's important to know how to use it properly as you can remove too much skin, cause bleeding and risk of infection. (see 'How to Use')
